Trump and the US military's top brass: a prelude to action? Focus on Charlie Kirk

By Larry Johnson

Region: United States

If you watched today's show at the Quantico Marine Corps base, where Donald Trump and the Secretary of War gave abominable speeches to over 800 senior officers, you must have heard Peggy Lee singing " *Is That All There Is* ?" Well, leave it to the brilliant Yves Smith to explain the reason for this meeting. She sent me the following message:

"Since Charlie Kirk, I may have become too fond of complex theories.

"But it's ridiculous to have summoned so many high-ranking officials for such a trivial agenda. A forceful memo and/or video sessions would have sufficed.

> "In my humble opinion, this large, inane meeting was intended to cover up a smaller meeting that was to take place there. And the fact that all these high-ranking officials were summoned spoke volumes about the purpose of the meeting."

No, Yves… I think you've hit the nail on the head. In addition to the presence of a large US naval squadron off the Venezuelan coast, we're now learning that US tanker planes are traveling to the Middle East via England. We observed the same phenomenon in the days leading up to the June 24 attack on Iran.

If the Trump administration is planning a coordinated attack on Venezuela and Iran, the commanders of USCENTCOM and USSOUTHCOM should be involved. While such plans could have been discussed during a SVTCS (secure video conference), these sessions are typically attended by dozens of people. If you want to keep such planning secret, the discussion takes place behind closed doors. If the commanders of CENTCOM and SOUTHCOM had been summoned to Washington alone, someone probably would have balked. With the presence of the U.S. naval force off the Venezuelan coast and the movement of American aircraft toward the Persian Gulf, such a maneuver would likely have attracted unwanted attention. Well done, Ms. Smith!

Regarding the murder of Charlie Kirk, I invite you to watch the following video, which clearly proves that the FBI's claim that the murder weapon was a .30-06 is impossible.

I received the following message late in the day from a friend with a good address book. He wrote:

> "A high-ranking person at TP USA told me that the bullet hit the C2 [cervical] and embedded itself in the C7. Charlie's neck was completely pulverized. The heart stopped instantly, and the bullet was found near the T1 [thoracic or dorsal vertebra] of the spine. He then added that bullet fragments were found, and no one told him it was a .30-06 caliber bullet. They just called it a 'bullet.' I hope you're doing well. I just wanted to pass the information along to you."

Bullet fragments are frangible ammunition. Frangible ammunition is a special bullet designed to disintegrate into small pieces when it strikes hard surfaces, such as steel or concrete. These bullets are typically made from compressed powdered metals, such as copper, tin, or zinc, designed to

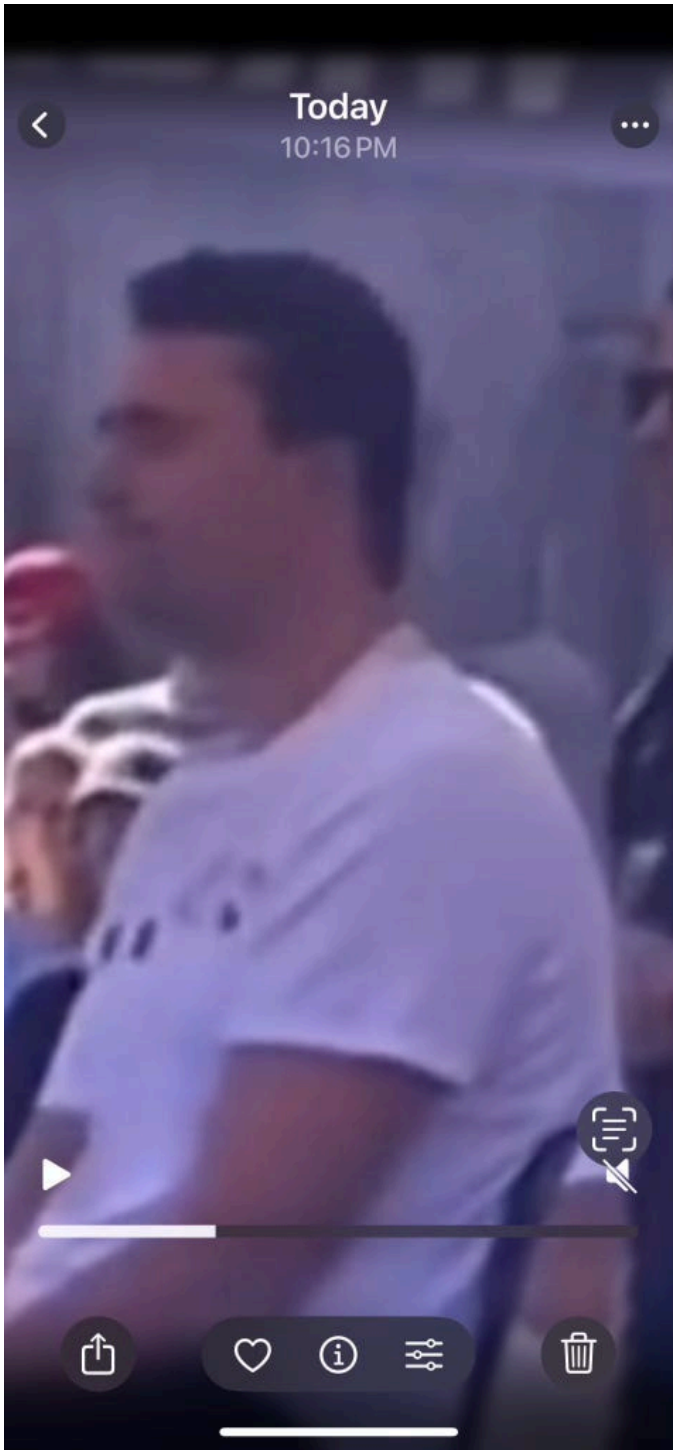
shatter on contact rather than retaining their shape or penetrating deeply. The primary purpose of frangible ammunition is to minimize the risk of ricochet, projection, and excessive penetration, making it ideal for use in indoor shooting ranges, short-range training, and environments where shooter safety and bystander protection are top priorities.

One weapon that may have been used to kill Charlie is the 300 Blackout fired from a short-barreled shotgun. Here's an example from Daniel Defense: the DDM4 V7P 300 Blackout semi-automatic pistol with a stabilizer mount . It can be fitted with a scope and easily hidden in a backpack:

I'm not saying that's the weapon that was used... I'm just showing you that there are a number of rifles that can fire this type of ammunition and be easily concealed.

Here is a video showing the cavitation effect of a 300 Blackout soft point bullet fired at 30 meters:

You can see the huge cavitation area caused by the bullet. It causes a shock wave that spreads in all directions inside the body. Here's the frame from the video where Charlie is hit. Remember, there are 30 frames per second, so what you're seeing is 1/30th of a second.



In the following image, we can observe the cavitation effect: the front and back of Charlie's t-shirt have moved up and out. Once again, this is 1/30th of a second:

The bullet that hit Charlie caused immediate cavitation in his body, causing his chest and neck to swell. However, the bullet did not exit. According to the previously mentioned report, the bullet struck his spine and fragmented, suggesting that it was indeed a frangible bullet.

I don't know what rifle and ammunition were used to kill Charlie Kirk. But it certainly wasn't a .30-06 bullet fired by Tyler Robinson. The video footage demands a proper investigation, not Kash Patel's puppet show.

On Monday, I participated in a roundtable discussion with Danny Haiphong, along with Matt Kennard and Patrick Henningsen:

And I had a very productive conversation with Marcello today… We discussed the murder of Charlie Kirk:
